Reading:

6/10 This article from the Guardian is about remakes of movies and whether they were successful or unsuccessful in the box office. Some of the remakes have been completely pointless because they were a shot for shot remake, but other remakes were loved even more than the original. One of the main series that the article talks about is How to train Your Dragon. The makers of the previous movies in this series have decided they are going to do a live action remake of this movie. We don't know whether this movie will be a hit or a flop, but we do know that it might be too soon for a remake as the latest movie in this series was made only four years ago.

STEM

good { I would like to study at AOL for the betterment of my education so that I can hopefully go to a good college and pursue my higher education there. Going to AOL will further instill discipline in me as there will be much more work there, such as research projects, tougher curriculum, and harder tests. The amount of pressure to complete my work will force me to be much more busy, however it will pay off because my future will be very successful. Speaking of the future, going to such a prestigious school will also prepare me for college too, because by the time someone graduates from this school, the work that is given in college will not be that much of a step up from AOL. In the Academies, I get the choice between AOS or AET, which means that based on what it want to study, you can pick AOS for science related studies, or

AET for technology related studies. This school will also increase creative thinking as it is needed for the work at this school. This is why I am determined to go to The Academies of Loudoun.

Math:

My answer is that she practiced for 90 minutes on monday. These are the steps I took to solve it. The first step I took was to simplify 2 hours and 15 minutes by converting it to 135 minutes. I then expressed the equation ' $2x + x = 135$ ' because if x is the amount of time that she practiced on tuesday, then the amount of time she spent on monday is $2x$ because it is double tuesdays time. Once I simplified the equation by making it ' $3x = 135$ ' I got ' $x = 45$ ' after that, all I had to do was get $2x$ which was 90, that's how I got my answer.
